

In this assignment, you are required to:

- Provide a corporate data solution for a **selected business problem** by building a NoSQL Application.
- You are required to document the solution by explaining the characteristic, applications, strengths and limitations.
- Submit the softcopy of your documentation (**PDF ONLY**) and application (**65 Marks**).
- You will have a viva session which will be published at a later date. Duration is 30 -- 45 minutes (**35 Marks**).

Learning Outcome is:

To understand what is meant by the family of database technologies usually referred to as NOSQL; And be able to explain the characteristic, applications, strengths and limitations of this family of database technologies.

Deliverables

The instructions for submitting files are:

- The coursework assessment is a report and the application. The report should explain the characteristic, applications, strengths and limitations of the NoSQL application.

The Viva

You are required to present your work at the viva day. Please note the following:

- You will be advised of the time and place where you will do your presentation in due course, but these will normally take place on the week after your submission.
- At the end of the demonstration you will be asked a series of questions to explore your understanding of the developed NoSQL application and expect to write commands.

Assessment Criteria:

The following guidelines indicate the standard that will be expected for each grade.

Grade A (70% and above)

A quality piece of work which demonstrates excellent understanding. The key and fundamental issues will be explored in detail, including aspects of concept and practice. The report should be clear and concise with a high standard of intellectual discussion. NoSQL application is very clear and functioning very well. The student will be able to discuss their design and implementation at the presentation and will be able to explain to describe the way in which they have attempted the project.

Grade B (60 – 69%)

Demonstrates a reasonable understanding of the problem. The report should be structured, demonstrating clarity of understanding and presentation.

The key and fundamental issues will be explored in some detail, including aspects of concept and practice. NoSQL application is very clear and functioning very well with minor issues. The student will be able to discuss their implementation at presentation and will be able to explain to describe the way in which they have attempted the project.

Grade C (50 – 59%)

Demonstrates an adequate understanding of the problem. The report should be structured in an acceptable manner with minor issues, demonstrating clarity of understanding and presentation. The key and fundamental issues will be explored in some detail, including aspects-of concept and practice. Working NoSQL application has presented by the student. The student will be able to discuss their implementation at presentation and will be able to explain to describe the way in which they have attempted the project.

Grade D (40 – 49%)

Demonstrates a basic understanding of the problem, outlining the fundamental and key issues of the topic area. Documentation will be adequate but explanations may be limited during the presentation. A bare minimum NoSQL application is given.

Grade E (fail) (40 – 0%)

Demonstrates poor understanding of the problem or no attempt at all. The NoSQL application may have limited functionality and major errors and/or omissions are likely. Documentation very limited or not to an acceptable standard. Explanations will be limited but sufficient to demonstrate that the student understands the work that has been submitted.

Zero marks will be awarded for non-submission.
